

## §10.3 - Series

After completing this section, students should be able to:

- Determine if a geometric series converges or diverges.
- Recognize a telescoping series and use its partial sums to determine if it converges or diverges.
- Determine if sums and scalar multiples of series converge or diverge based on the convergence status of their component series.

**Definition.** A geometric **sequence** is a sequence of the form ...  $\{ar^n\}_{n=0}^{\infty}$

**Definition.** A geometric **series** is a series of the form ...  $\sum_{n=0}^{\infty} ar^n$

**Example.** Is  $\sum_{i=2}^{\infty} \frac{5(-2)^i}{3^{2i-3}}$  a geometric series? If so, what is the first term and what is the common ratio?

$$\sum_{i=2}^{\infty} 5(-2)^i / 3^{2i-3}$$

$$\sum_{i=2}^{\infty} 5(-2)^i / (3^2)^i \cdot 3^{-3}$$

$$\sum_{i=2}^{\infty} 5 \cdot 27 \left( \frac{-2}{3^2} \right)^i$$

$$\sum_{i=2}^{\infty} 135 \left( \frac{-2}{9} \right)^i$$

$$\sum_{i=0}^{\infty} 135 \left( \frac{-2}{9} \right)^{i+2}$$

$$\sum_{i=0}^{\infty} 135 \left( \frac{-2}{9} \right)^i \left( \frac{-2}{9} \right)^2$$

$$\sum_{i=0}^{\infty} \frac{20}{3} \left( \frac{-2}{9} \right)^i$$

**Fact.** A geometric **sequence**  $\{ar^n\}_{n=0}^{\infty}$  converges to 0 when  $|r| < 1$ , converges to  $a$  when  $r = 1$  and diverges when  $|r| > 1$  or  $r = -1$ .

**Question.** For what values of  $r$  does the geometric **series**  $\sum_{n=0}^{\infty} ar^n$  converge?  
 $|r| < 1$

Strategy:

- Find a formula for the Nth partial sum  $\sum_{k=0}^N a \cdot r^k$ .
- Take the limit of the partial sums.

**Conclusion:** The geometric series  $\sum_{n=0}^{\infty} ar^n$  converges to  $\frac{a}{1-r}$  when  $|r| < 1$ .

The geometric series  $\sum_{n=0}^{\infty} ar^n$  diverges when  $|r| \geq 1$ .

You don't need to reindex  $\Sigma$  but  $a$  = first term of series

**Example.** Does  $\sum_{i=2}^{\infty} \frac{5(-2)^i}{3^{2i-3}}$  converge or diverge?

$$\sum_{i=2, \text{ infinity}} 5(-2)^i / 3^{2i-3} = 3^{2i} \cdot$$

$$\sum_{i=2, \text{ infinity}} 5(-2)^i / 3^{2i-3} = 9^i \cdot$$

$$\sum_{i=2, \text{ infinity}} 5/3^{2-3} (-2/9)^i$$

$$r = -2/9, a = 5/3^{2-3} (-2/9)^2$$

$$\text{sum} = a/(1-r) = 5/3^{2-3} (-2/9)^2 / (1 - (-2/9))$$

$$= 20/3 / 11/9$$

Tricks for determining when series converge:

**Trick 1:** Recognize geometric series.

**Review.** A geometric series is a series of the form:

$$\sum_{n=0, \text{ infinity}} ar^n$$

**Review.** For what values of  $r$  does a geometric **series** converge?

$$|r| < 1$$

**Example.** For what values of  $x$  does the series  $\sum_{n=2}^{\infty} \frac{3x^{n-1}}{2^n}$  converge? What does it converge to (in terms of  $x$ )?

$$\sum_{n=2, \text{ infinity}} 3 * x^n * x^{-1} / 2^n$$

$$\sum_{n=2, \text{ infinity}} 1/3x * (x/2)^n$$

$$r = x/2$$

$$|x/2| < 1 \rightarrow |x| < 2$$

$$-2 < x < 2$$

$$a = 3x^{-1} (x/2)^2 \quad \text{sum} = 3x^{-1}(x/2)^2 / 1 - x/2$$

**Trick 2:** Recognize telescoping series.

Series whose partial sums eventually have a fixed number of terms after cancelling

**Example.**  $\sum_{k=2}^{\infty} \ln\left(\frac{k}{k+1}\right)$

\*\*form: (something-something)

Step 1: Get in form  $\sum_{n=2, \text{infinity}} \ln k - \ln(k+1)$

Step 2: Plug in n values to get partial sums:

$$(\ln 2 - \ln 3) + (\ln 3 - \ln 4) + (\ln 4 - \ln 5) + \dots + (\ln(n-1) - \ln(n)) + (\ln(n) - \ln(n+1))$$

Step 3: Look for cancellations:

$$\ln 2 - \ln(n+1)$$

Step 4:  $\lim_{n \rightarrow \text{infinity}} \ln 2 - \ln(n+1)$

Goes to  $-\text{infinity}$ , Diverges

**Example.**  $\sum_{n=2}^{\infty} \frac{3}{n^2 - 1}$

$$3 \sum_{n=2, \text{ infinity}} \frac{1}{(n+1)(n-1)}$$

$$\frac{A}{n+1} + \frac{B}{n-1}$$

$$1 = \frac{A}{n-1} + \frac{B}{n+1} \rightarrow A = \frac{1}{2}$$

$$1 = \frac{A}{n-1} + \frac{B}{n+1} \rightarrow B = -\frac{1}{2}$$

$$3 \sum_{n=2, \text{ infinity}} \left( \frac{1}{2(n-1)} - \frac{1}{2(n+1)} \right)$$

$$3 \left[ \left( \frac{1}{2} - \frac{1}{6} \right) + \left( \frac{1}{6} - \frac{1}{10} \right) + \left( \frac{1}{10} - \frac{1}{14} \right) + \left( \frac{1}{14} - \frac{1}{18} \right) + \dots + \left( \frac{1}{2(n-2)} - \frac{1}{2(n-1)} \right) + \left( \frac{1}{2(n-1)} - \frac{1}{2(n+1)} \right) \right]$$

$$-\frac{1}{2(n)} + \frac{1}{2(n+1)}$$

**Trick 3:** Use Limit Laws.

**Fact.** If  $\sum_{n=1}^{\infty} a_n = A$  and  $\sum_{n=1}^{\infty} b_n = B$ , then

$$\sum_{n=1}^{\infty} a_n + b_n =$$

$$\sum_{n=1}^{\infty} a_n - b_n =$$

$$\sum_{n=1}^{\infty} c \cdot a_n =$$

where  $c$  is a constant.

**Example.** Does the series converge or diverge? If it converges, to what?

$$\sum_{n=1}^{\infty} \frac{4 \cdot 5^n - 5 \cdot 4^n}{6^n}$$

$$\Sigma(n=1, \text{infinity}) 4 \cdot 5^n / 6^n - \Sigma(n=1, \text{infinity}) 5 \cdot 4^n / 6^n$$

$$= 4 (5/6)^n - 5 (4/6)^n$$

$$r = 5/6, 4/6$$

$$a = 20/6, 20/6$$

$$((20/6) / 1 - 5/6) - ((20/6) / 1 - 4/6)$$

**Question.** True or False: If  $\sum_{n=1}^{\infty} a_n$  diverges and  $\sum_{n=1}^{\infty} b_n$  converges, then  $\sum_{n=1}^{\infty} (a_n + b_n)$  diverges.

True

$$c+c = c$$

$$c+d = d$$

$$c-c = C$$

**Question.** True or False: If  $\sum_{n=1}^{\infty} a_n$  diverges and  $\sum_{n=1}^{\infty} b_n$  diverges, then  $\sum_{n=1}^{\infty} (a_n + b_n)$  diverges.

Inconclusive

False

**Question.** True or False: If  $\sum_{n=1}^{\infty} a_n$  converges, then so does  $\sum_{n=5}^{\infty} a_n$ .  
False

**Question.** True or False: If  $\sum_{n=5}^{\infty} a_n$  converges, then so does  $\sum_{n=1}^{\infty} a_n$ .

True

$\sum_{n=1, \text{ infinity}} a_n + \sum_{n=5, \text{ infinity}} a_n$   
B+A

$a_1 + a_2 + a_3 + a_4 + A$

**Question.** True or False: If  $\sum_{n=1}^{\infty} a_n = A$  and  $\sum_{n=1}^{\infty} b_n = B$ , then  $\sum_{n=1}^{\infty} a_n \cdot b_n = A \cdot B$  False

**Question.** True or False: If  $\sum_{n=1}^{\infty} a_n = A$  and  $\sum_{n=1}^{\infty} b_n = B$ , then  $\sum_{n=1}^{\infty} \frac{a_n}{b_n} = \frac{A}{B}$ . False
